Spine Services

Intense pain, persistent numbness or weakness in the legs or arms may indicate a serious spinal condition such as spinal stenosis or sciatica. The Spine & Joint Center provides a comprehensive, interdisciplinary program dedicated to the diagnosis, evaluation, treatment, rehabilitation and education of patients with acute and chronic spine problems.

Our goal is to help patients return to an active lifestyle and to restore function. We offer diagnostic testing onsite including x-rays and EMG (electromyogram) testing.

manages painful discs. This pain management procedure is done right in our offices.

Surgery is considered carefully as the last option. When surgery is indicated, our fellowship-trained spine surgeons evaluate and treat patients with the most advanced technology for the best outcomes. For example, we use microsurgical techniques in the treatment of disc herniations. Since only a small incision is required, this technique allows for more accurate surgeries and faster recoveries.
